

How can I find a good codebase?

- Avoid Cybersecurity and Biology related codebases, these are currently not supported by the model's and will cause the submission to error.
- The codebase must be in a supported language, see [Welcome to Taiga](#) for the list of supported languages.
- The codebase must have an open source license (e.g., MIT, Apache, etc.), Do **not** use codebases with copyleft licensing.
- Be sure the codebase doesn't contain any confidential data or PII, see [Safe Practices](#) for more information on this.
- Start from your field of expertise. You'll be able to create more interesting and challenging problems from that vantage point.
- Leverage codebases that have at least a moderate amount of internal complexity (multiple code files, rely on interactions between functions and modules)
- Design effective searches in github for language, usage metrics (stars), and domain

Practical Steps

1. Open github.com
2. From the search box you can use the following configurations

Topic	Examples
Programming Language	<code>language:python</code> <code>language:typescript</code> <code>language:C</code>
Number of Stars	<code>stars:X..Y</code>
Codebase size in KB	<code>size:X..Y</code>
Topic	<code>cli</code> <code>game-engine</code>

3. Some full configurations

```
language:typescript stars:300..8000 size:10000..50000 topic:cli
language:python stars:200..3000 size:5000..50000 topic:game-engine
audio processing language:python stars:100..2000 size:3000..80000
```

4. Clone, test, and examine the repo on your local desktop.
5. Convert the codebase to a zip archive or download as a zip directly from GitHub.
6. Upload the zip to Taiga using 'mount files' 'pick files' and 'upload as single archive' when initializing your live-compare problem.
7. Once the zip archive is uploaded, you will be asked to verify the URL. Take the repo URL directly from GitHub and verify it is acceptable for training.

Keep in mind there is a 50MB per file upload limit in Taiga.
