

✓ Welcome to Taiga

Taiga evaluates real-world model behavior during long-horizon coding tasks. The goal is not just whether a model produces correct code. You are evaluating how a model reasons, communicates, scopes its work, handles uncertainty, and follows instructions.

Before you start tasking:

- Read through these instructions and watch the video in Labelbox under "Instructions".
- Ask any questions in the Discord channel.
- Make sure you have all the necessary access and that your Hubstaff is already set up correctly.

1 of 3

Current working languages: Python, C, C++, JavaScript/TypeScript, R, Rust, LISP are workable. Go and Java are not fully working yet.

If the language you're interested in isn't on this list, it's because it doesn't work. Please be sure to use a language that is fully supported.

Once you're ready, see "[Getting Started](#)" for instructions on how to begin. Also, watch the video showing the entire process here: [Submitting a task in Labelbox](#)

Note: Failure to read the instructions before starting work will result in immediate removal from the project.

How to use this document

This document is organized into tabs, each covering one topic of the Taiga project. You don't need to read it from start to finish. Use the table of contents below to find the tab you need, and come back to it whenever a question comes up.

Contents

1. **Welcome to Taiga**
2. **Getting Started**
3. **Finding a Codebase**
4. **Prompting Guide**
5. **Writing Rationales**
6. **Rationale Writing Guide**
7. **Submitting Your Task**
8. **Platform Instructions** (*mirrors the in-platform instructions*)
9. **Payment Guidelines**
10. **Access & Hubstaff Issues**
11. **FAQ & Additional Tips**
12. **Office Hours Recaps**
13. **Safe Practices**

To help navigate the instructions <https://treespotter.dev/> has been developed. Login with your personal email address used to access Alignerr. If you don't have access using your personal Alignerr email, reach out to **IanC** on Discord.

Getting access

You need the following before you can work on this project:

- **Alignerr Workforce email** ("example@alignerrworkforce.com") Used only for Taiga.
- **Hubstaff account**, connected to your Alignerr account with your personal email.
- **Discord channel access**, the official project channel (see [worldsim-codehumanpref-channel](#)).
- **Taiga platform access**: Please only utilize this [link](#) to access taiga. Do not go directly through <https://taiga.ant.dev/>. If you can't log in with your Workforce email, post about it in the

If Hubstaff is connected to your Alignerr account but you can't see your Hubstaff timer, start the timer from your Labelbox dashboard.

If you don't have access to any of the options above, the [Access & Hubstaff Issues](#) page explains how to resolve any problems you might encounter.

Payment

This project is paid by the hour, based on the time you report on the task submission form in Labelbox and log in Hubstaff. You're responsible for reporting your time accurately.

Both of the following are required for payment. Missing either results in non-payment:

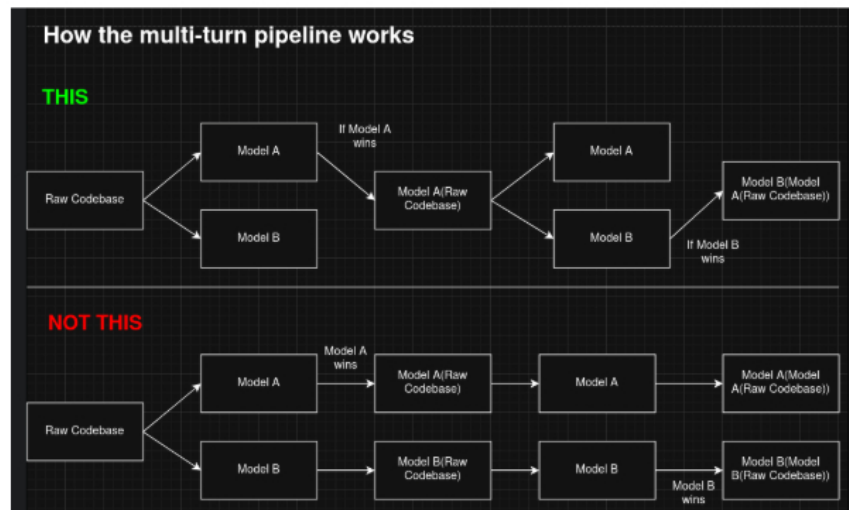

- Time tracked in Hubstaff.
- Task completed and submitted through the Labelbox platform.

Read the full [Payment Guidelines](#).

How conversations work

The multi-turn pipeline

Each follow-up turn continues only from the codebase and context of whichever model was preferred overall in the previous turn, not from a fixed model's own history. The diagram below shows how this works.

- Tasks should evolve naturally across turns. See the [Prompting Guide](#).

- Conversations typically run more than 3 turns and fewer than 15. If you reach 30 turns you must submit the task and start a new submission.
- Direct the conversation the way you would a real engineering task. It should read as authentic, and it can span many different task categories.
- Don't stop a conversation just because the original feature or request is complete. If you hit a natural stopping point before context is exhausted, continue with a new task category in your next turn prompt by clicking Submit Preference.

Reaching the token target

The goal is authentic, long-horizon engineering work, not reaching 1,000,000 tokens for its own sake. The context-low error, which fires near that point, is just the signal that a task is complete. Don't submit before you see it. Maintain context throughout.

To confirm you've hit a genuine context-low error, open the Jobs tab, select "Show Only My Jobs," and select the task you're working on. The correct error message reads:

`tokens.placeholder_token_count >= self.max_allowed_n_ctx=900000`

Assistant: ' is too long: tokens.placeholder_token_count=914156 >= self.max_allowed_n_ctx=900000, consider a filtering then upstream in raw_prompt_to_prompt()

Don't rely on the live "tokens remaining" counter for a precise reading.

A task is only complete once one of the two models hits this context error. This error will occur when

Turn and time limits

- Maximum 30 turns per conversation. If you complete 30 turns, submit the task in Labelbox and start a new submission.
- AHT should be around 100 minutes per turn on average.

Handling platform errors

If the platform errors out mid-turn and stops you from continuing, check the error message to determine if the error is a platform error or a completed task error. If this is a platform error and clicking retry didn't resolve the error (if the retry option is present), submit the task in Labelbox. The Labelbox form will ask "Were you able to complete this task? Select 'No' only if an error or platform failure prevented you from completing this task." be sure to detail the error message in the comment box after selecting "no" if a platform error has occurred. A submission is not considered invalid solely because of a platform error; you will still be paid for your time spent on the submission if the time working on the task is accurately reflected in your Hubstaff.

Writing rationales across turns

Make sure your rationale for each axis covers every relevant point. Comparisons must address both models explicitly, including where the losing model fell short (for example, where Model A went out of scope, not just that Model B stayed in scope).

Read the [Writing Rationales](#) page to learn how to fill out each field correctly.

What's next

Once you see the context-low error, you've reached the end of the conversation. Move on to [Submitting Your Task](#).

Rules

Expected Quality

- We expect high-quality submissions that are compatible with senior, experienced

General rules

- Do not write prompts on Taiga that request the model to generate malware or ask the model to exfiltrate sensitive data (keys, credentials, or secrets) or for software that would be illegal. This rule applies to all turns, not just the first turn.
- VPN usage is prohibited.
- Every task must have more than one turn. This project requires long-horizon, multi-turn conversations.
- Tasks expire 7 days after creation. This is a platform limitation with no workaround, so complete each task within 7 days.
- Submit only completed tasks to Labelbox. Never submit a task you haven't finished or are still working on.
- Track your time in Hubstaff during every working session, and keep your reported time per submission accurate.
- Don't open, view, write, or edit tasks created by other users. This is monitored.

Important!

Failing to follow any of these instructions will get you removed from the project.

Support

Reach the project managers through the project Discord channel.

- Use [Discord](#) for questions and support.

Office hours

Monday, Wednesday, and Friday at 11:00 AM PT

>>The link will be posted in the Discord channel before the meeting!<<

Bring edge cases, guideline questions, or tasking issues. We'll be live to give definitive answers and clarify client expectations.

Feedback

Feedback

Individual feedback is worked through a review backlog with no fixed timeline.
